

## Inventory Base

This is an inventory application. Although this application doesn't have the same purpose as the application we are developing, it does have some similar features. This allows you to add a property to a database, logging specific details such as the address, how many bedrooms etc it has. This application then allows the user to create rooms and take photographs on the devices camera and finally an inventory is generated. This application is used by letting agents to generate inventories of the properties, rather than a final advert but this is similar to our goal. This application looks very modern and is a similar style to how our project will be. (InventoryBase, 2019)
